

# First examples of the amazing diversity of Asn-linked glycans from “Chlorella“ microalgae

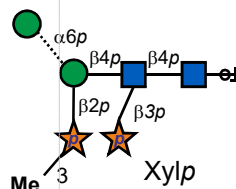

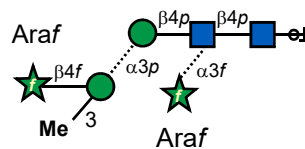

Microalgae marketed under the genus name „Chlorella“ sofar exhibited about a dozen of different N-glycan types (Plant J. 103, 184, 2020), of which five have to date been structurally elucidated. These first examples already harbor about 15 novel structural features. Questions about taxonomy, biosynthesis and most of all function arise.
