

Walking and the Potential for Social Contact

Antonio Páez

School of Geography and Earth Sciences

McMaster University

Frontiers in Transportation

August 2, 2013

Background

- Social contact
 - Innovation, productivity, technology adoption (Carlino et al. 2007; Sedgley and Elmslie 2011; Abel et al. 2012; McMichael and Shipworth 2013)
 - Social cohesion, social capital, segregation (Hilber 2010; Leyden 2003; Forrest and Kearns 2001; Grannis 1998)
 - Well-being and quality of life (Wang and Schwanen 2011; Doi et al. 2008)

Background

- Social contact is mediated by mobility
 - Density facilitates face-to-face contact (Duany and Plater-Zyberk, 2001; Talen, 1999), low density limits potential for interaction (Farber and Páez 2011)
 - Importance of face-to-face contact for ‘sense of community’ (Glynn 1981; Nasar and Julian 1995; Grannis 2009; Whalen et al. 2012) but possible limitations at high levels of density (Bramley and Power 2009; Bramley et al. 2009)

Background

- Social contact is mediated by mobility
 - Travel for social and leisure activities (van den Berg et al. 2013; Carrasco and Cid-Aguayo 2012; Ettema and Schwanen 2012; LeMondia and Bhat 2012; van Acker et al. 2011; Ohnmacht et al. 2009; Sener et al. 2008)

Background

- Previous work on potential for social contact
 - Urban contact fields (Moore 1970; Moore and Brown 1970; Dacey 1971)
 - Highly abstract, mainly concerned with analytical solutions for simple geometries (e.g. circular city)

Background

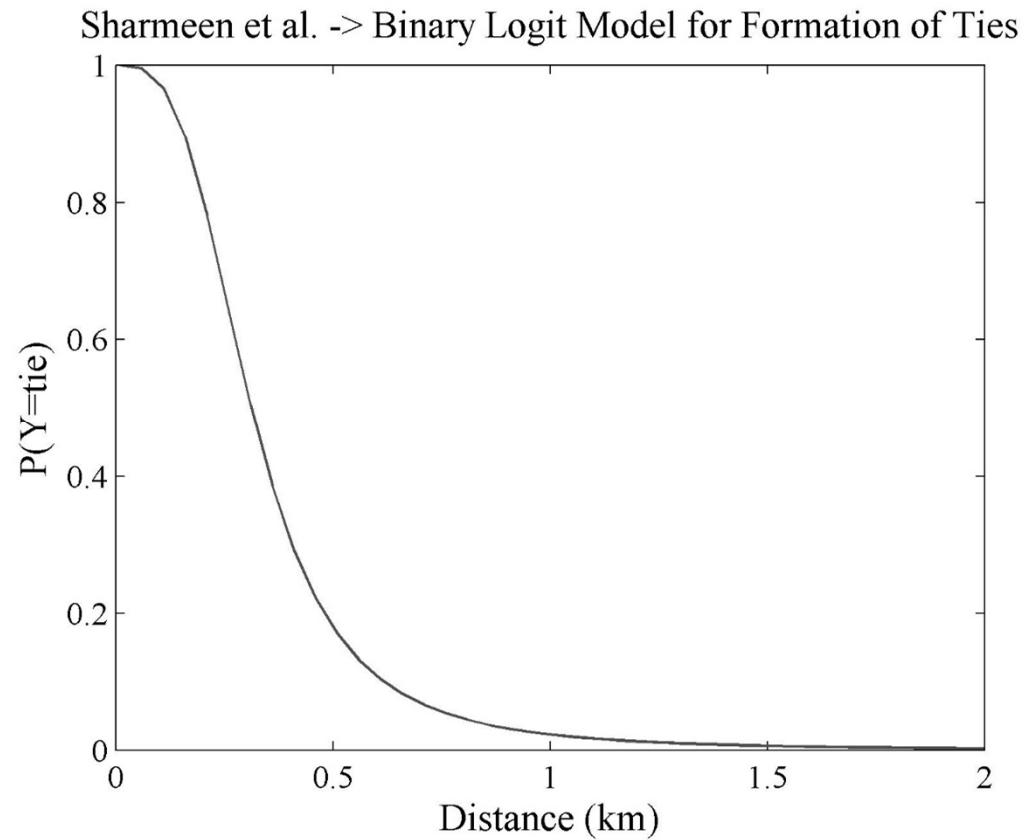

- Previous work on potential for social contact
 - Space-time concepts (space-time paths, potential path areas)
 - Mobility-based exposure (Wang and Shaw 2011; Farber et al. 2012)
 - Social Interaction Potential metrics (Farber et al. 2013; Farber and Li 2013)

Background

- Previous work on potential for social contact
 - Mobility at a relatively large scale assuming (implicitly or explicitly) motorized travel

Background

- Mobility
 - Social tie formation (Sharmeen et al.)

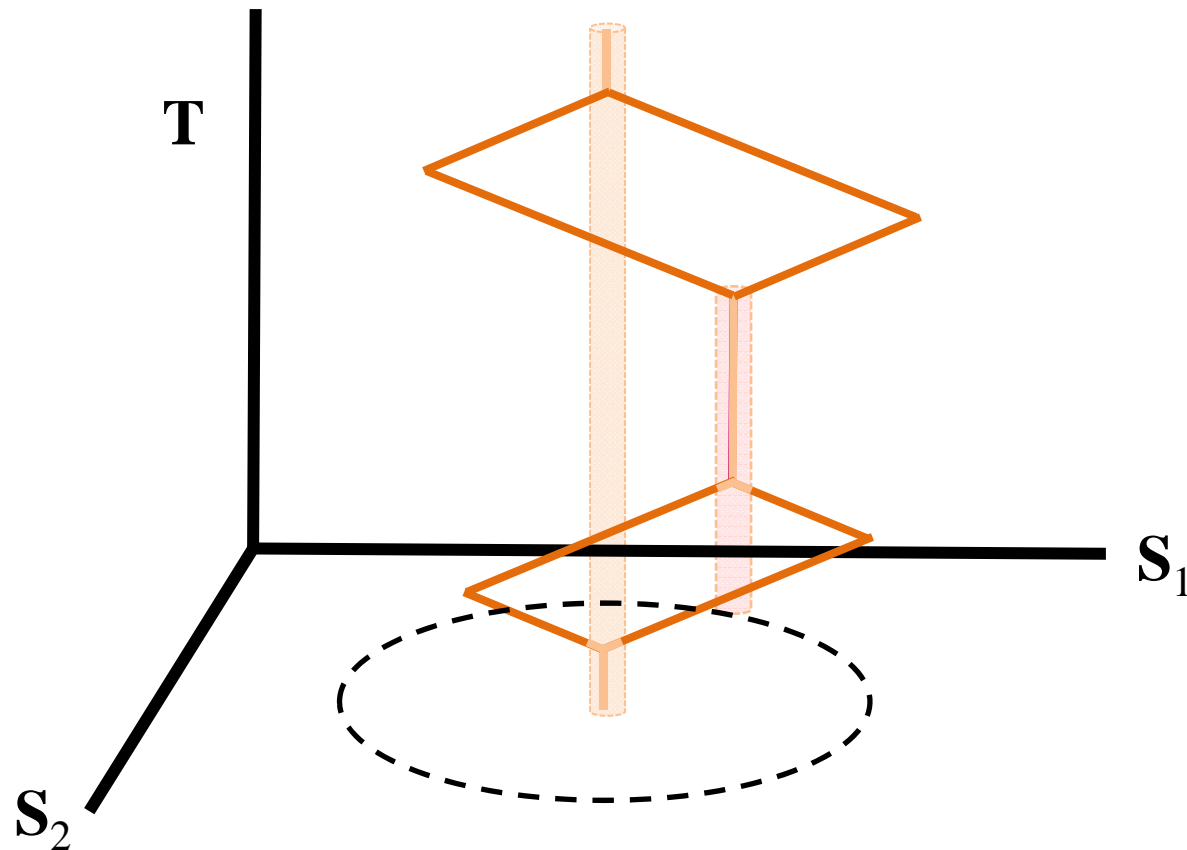

Objective

- Measuring potential for social contact at the scale of non-motorized mobility

Approach

- Use pedsheds to establish the size of the contact field

Approach

- Use G statistic (local concentration) to measure exposure
 - Contact potential of field: proportion of population of type r within field of individual profile p
 - Field defined for each spatial location i

$${}_{p}G_i^r = \frac{\sum_{j=1}^n w_{ij} (\hat{d}_{pi}) x_j^r}{\sum_{j=1}^n x_j^r}$$

Technical Issues

- Pedsheds
 - Previously, models of trip length (Mercado and Páez 2009; Morency et al. 2011)
 - Trip length by mode: crude approach used indicator variables for mode used
- Joint discrete-continuous model
 - Modal choice (including walking)
 - Trip length by mode

Technical Issues

- Information about population for exposure
 - Previously census information
 - Change of support due to size of pedshed areas
- Pycnophilactic (mass-preserving) interpolation

Empirical Application

- Potential for social contact from the perspective of mature/older adults
 - Importance of social contact for mental health and well-being (Nyqvist et al. 2013)
- Montreal Travel Survey 2008: home-based trips
- Spatial expansion of parameters for walking and walking trip length

Population Aged <24

Walking Behavior

- For detailed results, see [Moniruzzaman et al. \(2013\)](#)

Walking Behavior

- Two profiles for analysis
 - P1: Male 55-64, Drivers License, Couple, Full Time Job, Income 80-100k, Urban Form/Built Environment as per grid centroid
 - P2: Female 55-64, No Drivers License, Couple, At Home, Income 80-100k, Urban Form/Built Environment as per grid centroid

P1 Walking Trip Length (m)

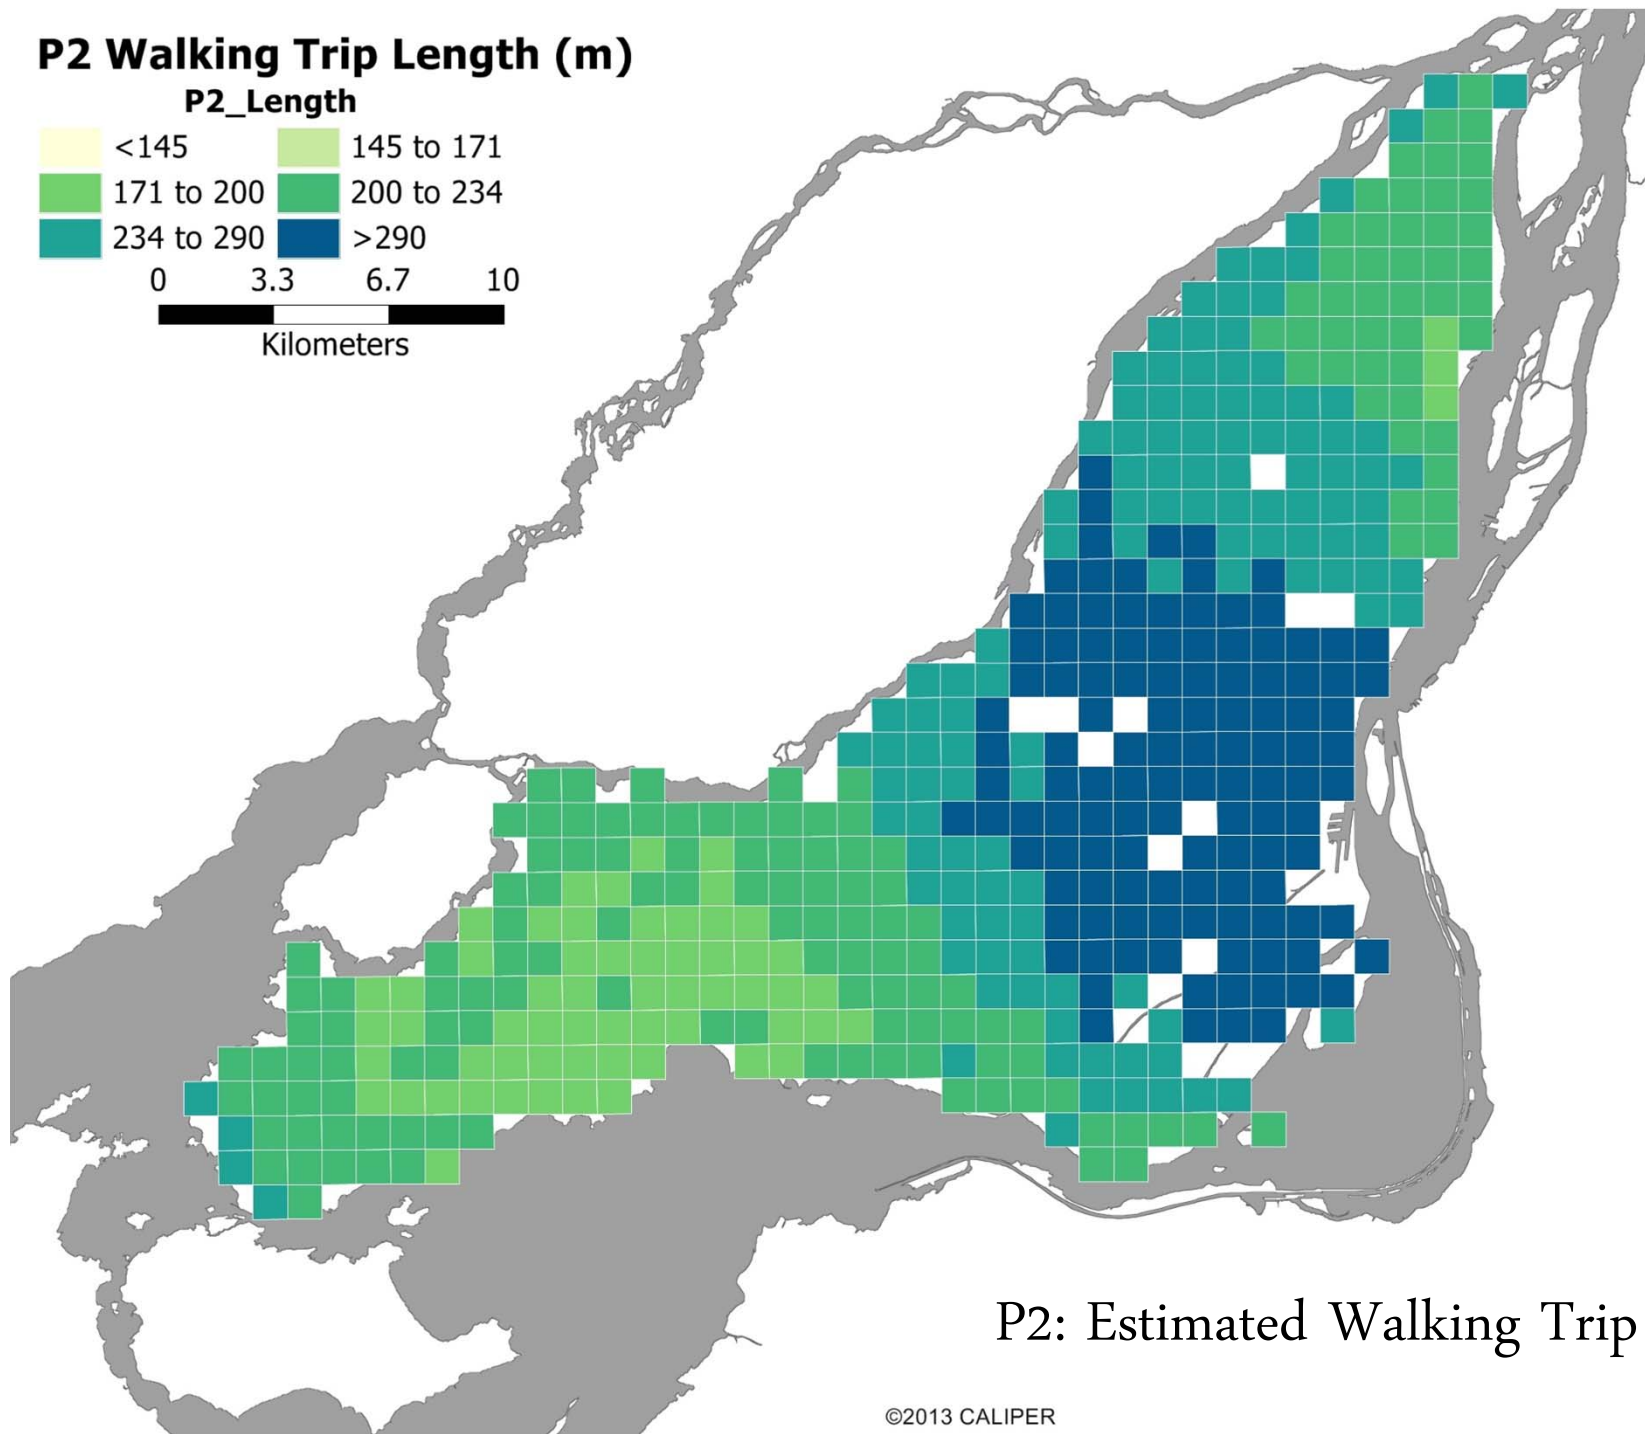

P1_Length

P1: Estimated Walking Trip Length

P2 Walking Trip Length (m)

P2_Length

P2: Estimated Walking Trip Length

Potential for Social Contact

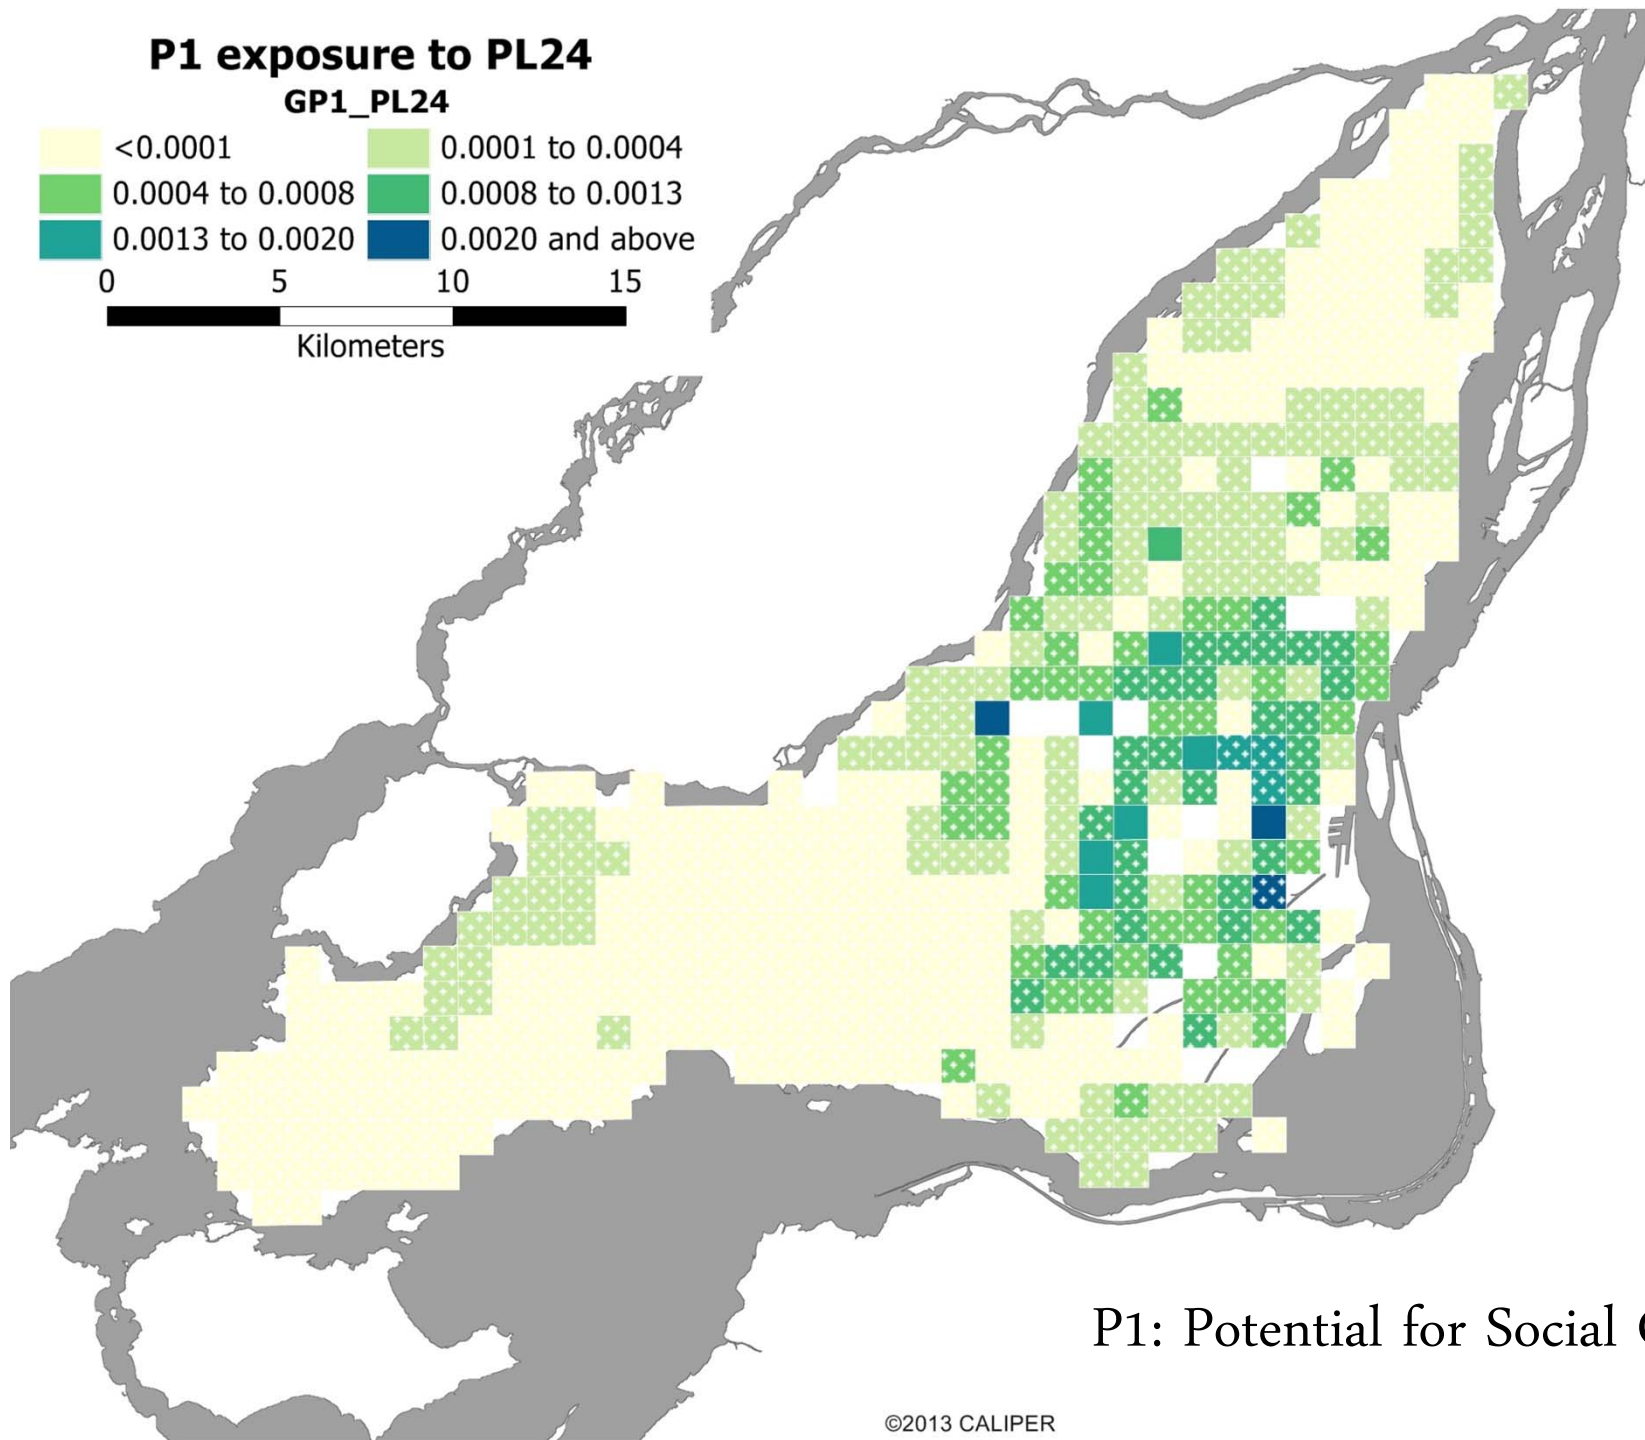

- Weight by probability of walking

$${}^r_p G_i^* = \frac{\sum_{j=1}^n w_{ij} (\hat{d}_{pi}) x_j^r P_{pi}}{\sum_{j=1}^n x_j^r P_{pi}}$$

- Significance testing conducted in usual fashion

GP2_P55to64

P2: Potential for Social Contact

Conclusions

- Potential for social contact varies widely, depending on mobility behavior and reference population group
- Related work: effect of distance on tie formation/maintenance
(Carrasco, Matous, Sharmeen et al.)
 - Potential for tie formation

Conclusions

- Possible applications
 - Identification of areas of policy interest
 - Case study site selection
 - Related outcomes: wellbeing, mass effects (Abou-Zeid et al., Dugundji)
