Table 1

Means for common bunt (CB) [% incidence], leaf blotch (LB), powdery mildew (PM), leaf rust (LR), stem rust (SR) and yellow rust (YR) [1-9 severity scores] incidence/severity scores of the HealthyMinorCereals spelt diversity panel tested across multiple locations and seasons. The panel displayed broad quantitative variation in resistance to fungal diseases, including resistance to common bunt. Sofia 1 and Albin showed lowest common bunt incidence. Sofia 1 appeared moderately resistant to several fungal pathogens and could be a useful crossing parent.

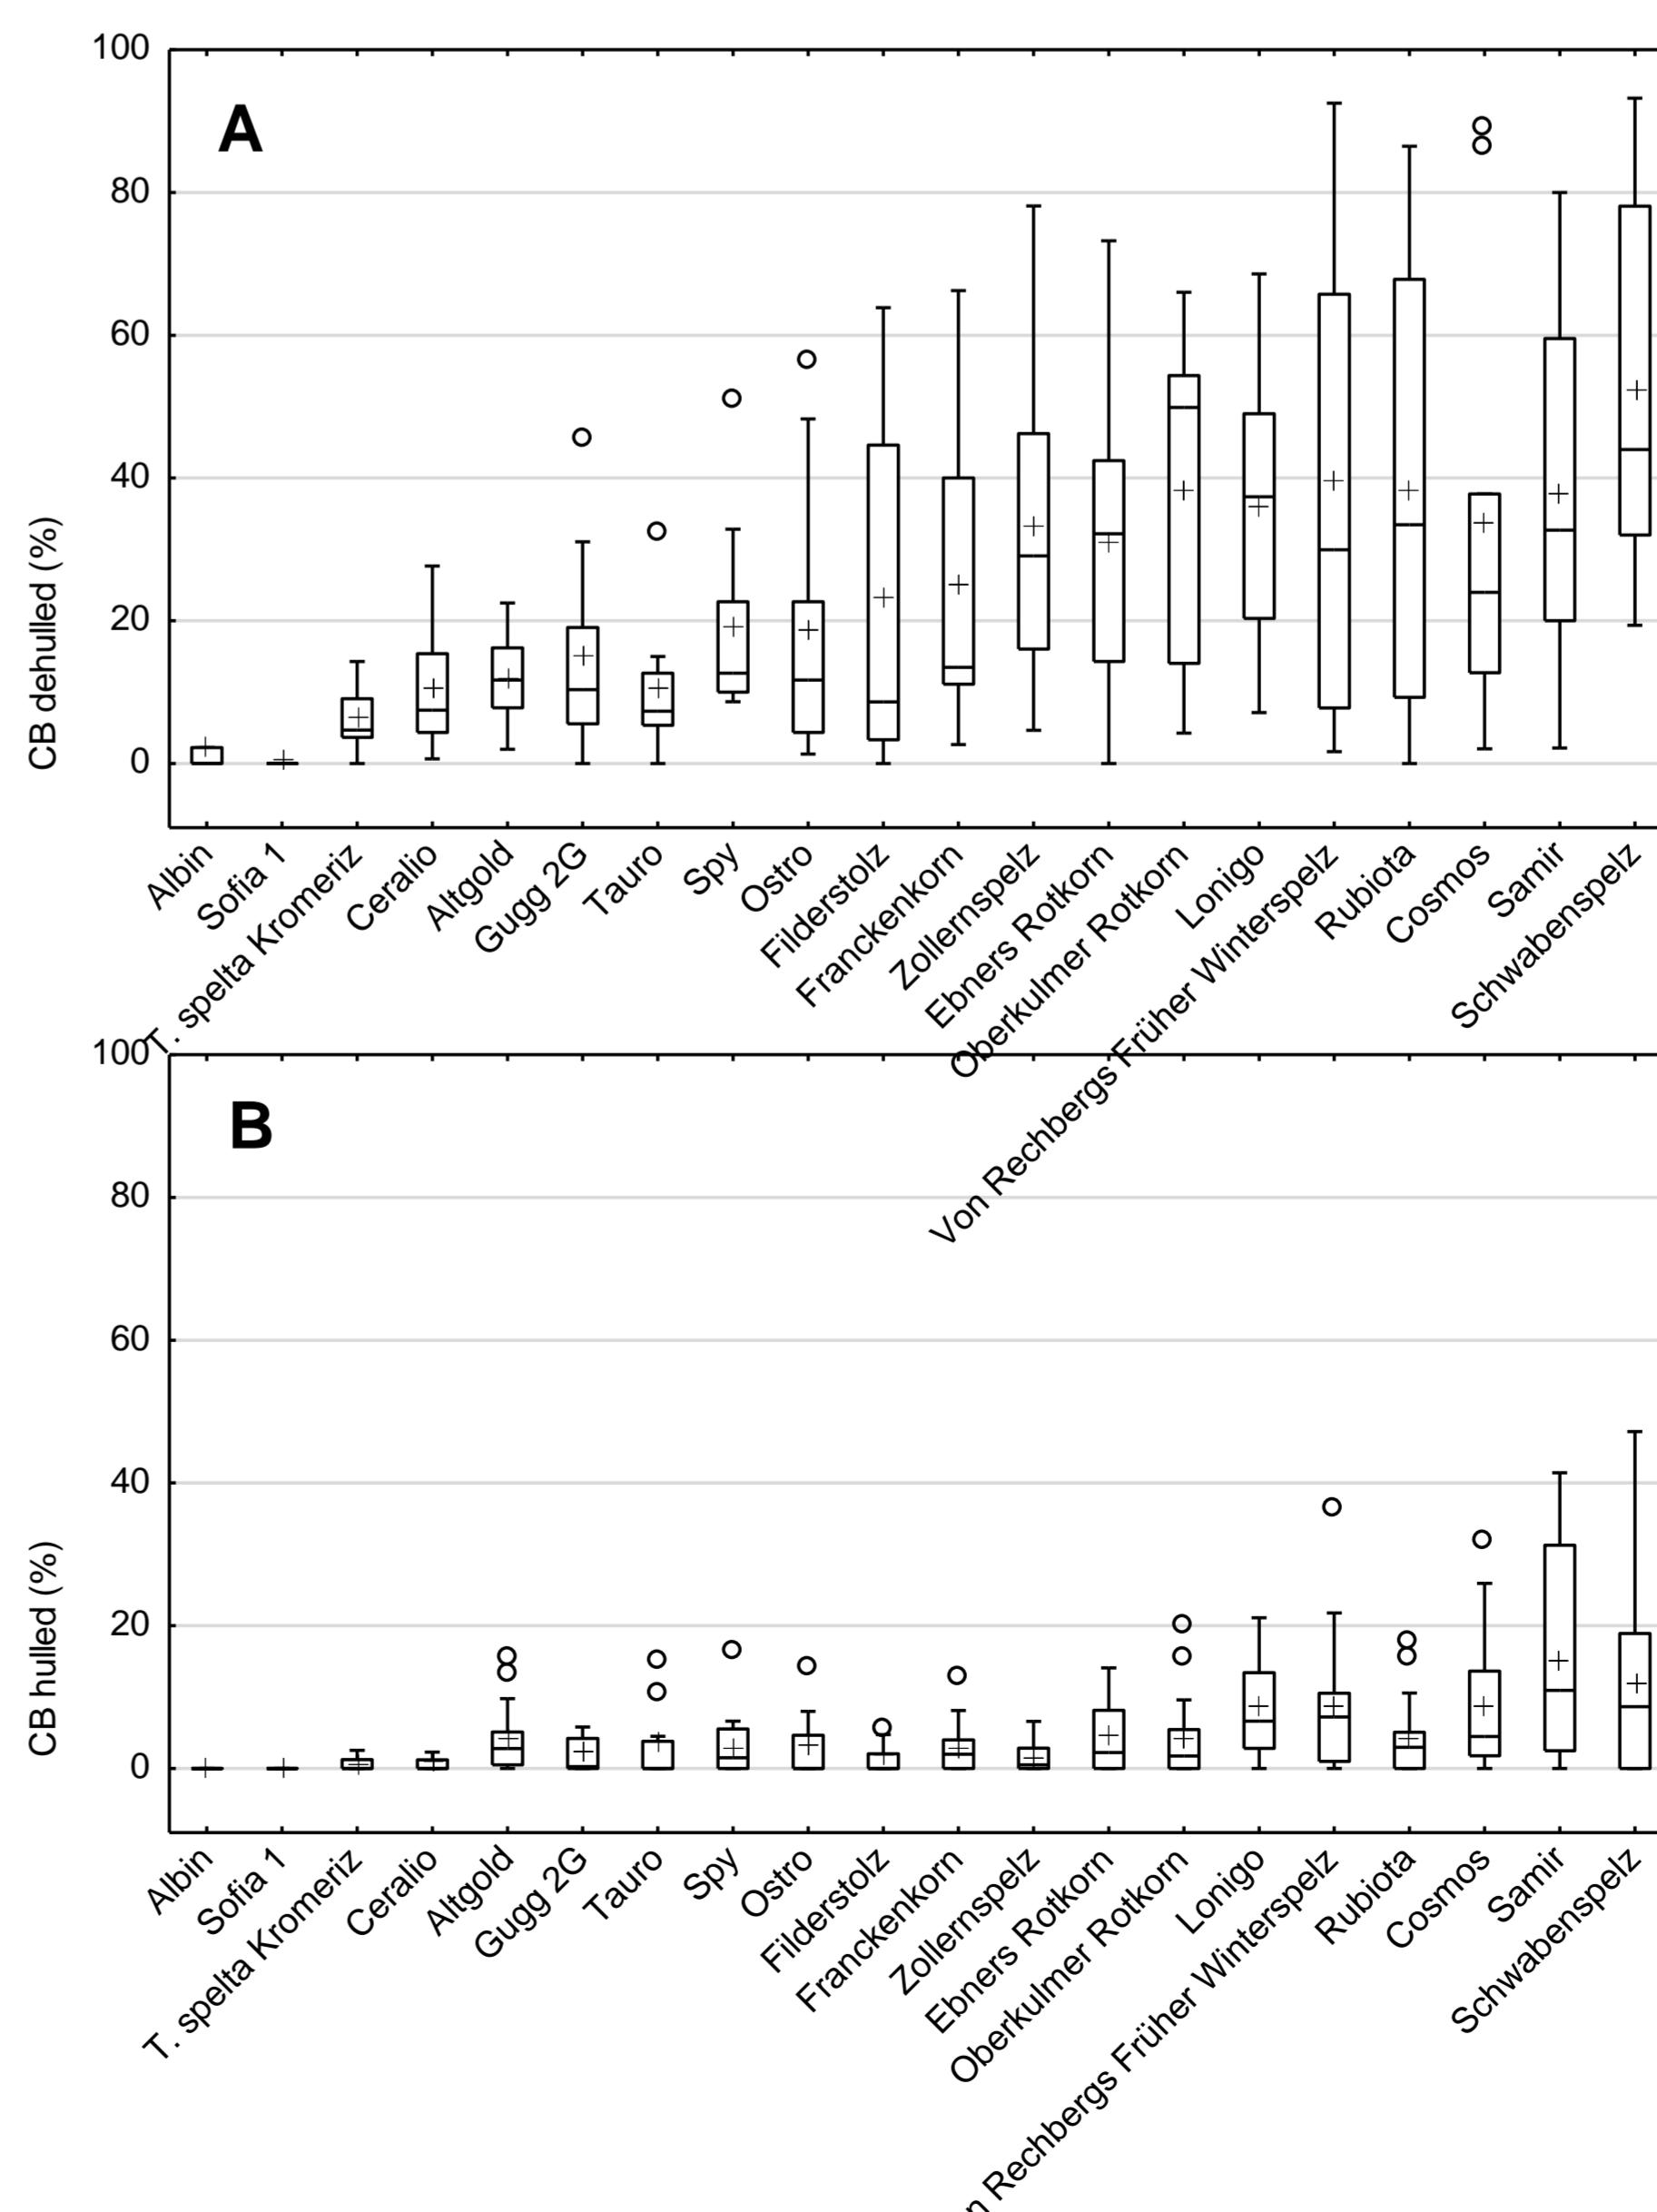

Figure 1

Bunt spore inoculation of dehulled seeds (A) led to significantly higher bunt incidence than inoculation of hulled bunt seeds (B) in artificially inoculated experiments.

Funding The research leading to these results has received funding from the European Union's Seventh Framework Programme for research, technological development and demonstration under grant agreement n° 613609 and from the Ministry of Agriculture of the Czech Republic, Project No. MZE ČR RO0423.
